5 Module Documentation 3

5 Module Documentation

5.1 API reference

Modules

- Utilities
- String
- String map
- HTTP server
- Path routing

5.1.1 Detailed Description

The API reference grouped by feature.

5.2 Utilities

Typedefs

- typedef void *(* sg_malloc_func) (size_t size)
- typedef void *(* sg_realloc_func) (void *ptr, size_t size)
- typedef void(* sg free func) (void *ptr)
- typedef void(* sg_err_cb) (void *cls, const char *err)
- typedef ssize_t(* sg_write_cb) (void *handle, uint64_t offset, const char *buf, size_t size)
- typedef ssize_t(* sg_read_cb) (void *handle, uint64_t offset, char *buf, size_t size)
- typedef void(* sg_free_cb) (void *handle)
- typedef int(* sg save cb) (void *handle, bool overwritten)
- typedef int(* sg_save_as_cb) (void *handle, const char *path, bool overwritten)

Functions

- unsigned int sq version (void)
- const char * sg_version_str (void)
- int sg_mm_set (sg_malloc_func malloc_func, sg_realloc_func realloc_func, sg_free_func free_func)
- void * sg_malloc (size_t size) __attribute__((malloc))
- void * sg_alloc (size_t size) __attribute__((malloc))
- void * sg realloc (void *ptr, size t size) attribute ((malloc))
- void sg_free (void *ptr)
- char * sg_strerror (int errnum, char *errmsg, size_t errlen)
- bool sg_is_post (const char *method)
- char * sg_extract_entrypoint (const char *path)
- char * sg_tmpdir (void)
- ssize_t sg_eor (bool err)
- int sg_ip (const void *socket, char *buf, size_t size)

5.2.1 Detailed Description

All utility functions of the library.

5.2.2 Typedef Documentation

5.2.2.1 sg_malloc_func

```
typedef void*(* sg_malloc_func) (size_t size)
```

Callback signature used to override the function which allocates a new memory space.

Parameters

in	size	Memory size to be allocated.

5.2 Utilities 5

Returns

Pointer of the allocated memory.

Return values

NULL	If size is 0 or no memory space.
	in election of the internet of epacer

5.2.2.2 sg_realloc_func

```
typedef void*(* sg_realloc_func) (void *ptr, size_t size)
```

Callback signature used to override the function which allocates a new zero-initialized memory space.

Parameters

in	size	Memory size to be allocated.
----	------	------------------------------

Returns

Pointer of the zero-initialized allocated memory.

Return values

NULL If siz	e is 0 or no memory space.
-------------	----------------------------

5.2.2.3 sg_free_func

```
typedef void(* sg_free_func) (void *ptr)
```

Callback signature used to override the function which reallocates an existing memory block.

Parameters

in,out	ptr	Pointer of the memory to be reallocated.
in	size	Memory size to be reallocated.

Returns

Pointer of the reallocated memory.

5.2.2.4 sg_err_cb

```
typedef void(* sg_err_cb) (void *cls, const char *err)
```

Callback signature used by functions that handle errors.

Parameters

out	cls	User-defined closure.
out	err	Error message.

5.2.2.5 sg_write_cb

```
typedef ssize_t(* sg_write_cb) (void *handle, uint64_t offset, const char *buf, size_t size)
```

Callback signature used by functions that write streams.

Parameters

out	handle	Stream handle.
out	offset	Current stream offset.
out	buf	Current buffer to be written.
out	size	Size of the current buffer to be written.

Returns

Total written buffer.

5.2.2.6 sg_read_cb

```
typedef ssize_t(* sg_read_cb) (void *handle, uint64_t offset, char *buf, size_t size)
```

Callback signature used by functions that read streams.

Parameters

	out <i>handle</i>		Stream handle.
	out	offset	Current stream offset.
	out	buf	Current read buffer.
Γ	out	size	Size of the current read buffer.

Returns

Total read buffer.

5.2.2.7 sg_free_cb

```
typedef void(* sg_free_cb) (void *handle)
```

Callback signature used by functions that free streams.

5.2 Utilities 7

Parameters

out <i>handle</i> Stream har	dle.
out <i>handle</i> Stream har	dle.

5.2.2.8 sg_save_cb

```
typedef int(* sg_save_cb) (void *handle, bool overwritten)
```

Callback signature used by functions that save streams.

Parameters

out	handle	Stream handle.
out	overwritten	Overwrite an already existed stream.

Return values

0	Success.
E <error></error>	User-defined error to abort the saving.

5.2.2.9 sg_save_as_cb

```
typedef int(* sg_save_as_cb) (void *handle, const char *path, bool overwritten)
```

Callback signature used by functions that save streams. It allows to specify the destination file path.

Parameters

out	handle	Stream handle.
out	path	Absolute path to store the stream.
out	overwritten	Overwrite an already existed stream.

Return values

0	Success.
E <error></error>	User-defined error to abort the saving.

5.2.3 Function Documentation

5.2.3.1 sg_version()

Returns the library version number.

Returns

Library version packed into a single integer.

5.2.3.2 sg_version_str()

Returns the library version number as string in the format <MAJOR>.<MINOR>.<PATCH>.

Returns

Library version packed into a null-terminated string.

5.2.3.3 sg_mm_set()

Overrides the standard functions malloc(3), realloc(3) and free(3) set by default in the memory manager.

Parameters

in	malloc_func	Reference to override the function $malloc()$.
in	realloc_func	Reference to override the function realloc().
in	free_func	Reference to override the function free ().

Return values

0	Success.
EINVAL	Invalid argument.

Note

It must be called before any other Sagui function or after all resources have been freed.

5.2.3.4 sg_malloc()

Allocates a new memory space.

5.2 Utilities 9

Parameters

in	size	Memory size to be allocated.
----	------	------------------------------

Returns

Pointer of the allocated memory.

Return values

```
NULL If size is 0 or no memory space.
```

Note

```
Equivalent to malloc(3).
```

5.2.3.5 sg_alloc()

Allocates a new zero-initialized memory space.

Parameters

in	size	Memory size to be allocated.

Returns

Pointer of the zero-initialized allocated memory.

Return values

```
NULL If size is 0 or no memory space.
```

Examples

```
example_httpsrv_tls_cert_auth.c.
```

5.2.3.6 sg_realloc()

Reallocates an existing memory block.

Parameters

in,out	ptr	Pointer of the memory to be reallocated.
in	size	Memory size to be reallocated.

Returns

Pointer of the reallocated memory.

Note

```
Equivalent to realloc(3).
```

5.2.3.7 sg_free()

```
void sg_free (
     void * ptr )
```

Frees a memory space previously allocated by sg_malloc(), sg_alloc() or sg_realloc().

Parameters

in	ptr	Pointer of the memory to be freed.
----	-----	------------------------------------

Note

```
Equivalent to free(3).
```

Examples

example_httpsrv_tls_cert_auth.c.

5.2.3.8 sg_strerror()

```
char* sg_strerror (
    int errnum,
    char * errmsg,
    size_t errlen )
```

Returns string describing an error number.

Parameters

in	errnum	Error number.
in,out	errmsg	Pointer of a string to store the error message.
in	errlen	Length of the error message.

5.2 Utilities 11

Returns

Pointer to str.

Examples

 $example_httpsrv_tls_cert_auth.c, \\ \textbf{and} \\ example_httpuplds.c. \\$

5.2.3.9 sg_is_post()

Checks if a string is a HTTP post method.

Parameters

in method Null-terminated string.

Return values

```
true If method is POST, PUT, DELETE or OPTIONS.
```

5.2.3.10 sg_extract_entrypoint()

Extracts the entry-point of a path or resource. For example, given a path /api1/customer, the part considered as entry-point is /api1.

Parameters

path	Path as null-terminated string.	

Returns

Entry-point as null-terminated string.

Return values

NULL	If no memory space is available.
------	----------------------------------

Warning

The caller must free the returned value.

5.2.3.11 sg_tmpdir()

```
char* sg_tmpdir (
     void )
```

Returns the system temporary directory.

Returns

Temporary directory as null-terminated string.

Return values

NULL	If no memory space is available.
------	----------------------------------

Warning

The caller must free the returned value.

Examples

example_httpuplds.c.

5.2.3.12 sg_eor()

```
ssize_t sg_eor (
          bool err )
```

Indicates the end-of-read processed in sg_httpres_sendstream().

Parameters

in err true to return a value indicating a s	stream reading error.
--	-----------------------

Returns

Value to end a stream reading.

5.2.3.13 sg_ip()

Obtains the IP of a socket handle (e.g. the one returned by sg_httpreq_client()) into a null-terminated string.

5.2 Utilities 13

Parameters

in	socket	Socket handle.
out	buf	Pointer of the string to store the IP.
in	size	Size of the string to store the IP.

0	Success.
EINVAL	Invalid argument.
EAFNOSUPPORT	Address family not supported by protocol.
ENOSPC	No space left on device.

5.3 String

Data Structures

• struct sg_str

Functions

```
• struct sg_str * sg_str_new (void) __attribute__((malloc))
```

- void sg_str_free (struct sg_str *str)
- int sg_str_write (struct sg_str *str, const char *val, size_t len)
- int sg_str_printf_va (struct sg_str *str, const char *fmt, va_list ap)
- int sg_str_printf (struct sg_str *str, const char *fmt,...) __attribute__((format(printf
- int const char * sg_str_content (struct sg_str *str)
- size_t sg_str_length (struct sg_str *str)
- int sg_str_clear (struct sg_str *str)

5.3.1 Detailed Description

String handle and its related functions.

5.3.2 Function Documentation

```
5.3.2.1 sg_str_new()
```

Creates a new zero-initialized string handle.

Returns

String handle.

Return values

```
NULL If no memory space is available.
```

Examples

example_httpuplds.c, example_router_srv.c, and example_str.c.

5.3 String 15

5.3.2.2 sg_str_free()

Frees the string handle previously allocated by sg_str_new().

Parameters

in	str	Pointer of the string handle to be freed.
----	-----	---

Examples

example_httpuplds.c, example_router_srv.c, and example_str.c.

5.3.2.3 sg_str_write()

Writes a null-terminated string to the string handle str. All strings previously written are kept.

Parameters

in	str	String handle.
in	val	String to be written.
in	len	Length of the string to be written.

Return values

0	Success.
EINVAL	Invalid argument.

5.3.2.4 sg_str_printf_va()

Prints a null-terminated formatted string from the argument list to the string handle str.

Parameters

in	str	String handle.
in	fmt	Formatted string (following the same printf() format specification).
in	ар	Arguments list (handled by va_start()/va_end()).

Return values

0	Success.
EINVAL	Invalid argument.

5.3.2.5 sg_str_printf()

Prints a null-terminated formatted string to the string handle str. All strings previously written are kept.

Parameters

	in	str	String handle.
	in	fmt	Formatted string (following the same <code>printf()</code> format specification).
ĺ	in		Additional arguments (following the same <code>printf()</code> arguments specification).

Return values

0	Success.
EINVAL	Invalid argument.

Examples

example_httpuplds.c, example_router_srv.c, and example_str.c.

5.3.2.6 sg_str_content()

Returns the null-terminated string content from the string handle str.

Parameters

in str Stri	ng handle.
-------------	------------

Returns

Content as null-terminated string.

5.3 String 17

Examples

example_httpreq_payload.c, example_httpuplds.c, example_router_srv.c, and example_str.c.

5.3.2.7 sg_str_length()

Returns the total string length from the handle str.

Parameters

in	str	String handle.

Returns

Total string length.

Return values

EINVAL	Invalid argument.
--------	-------------------

5.3.2.8 sg_str_clear()

Clears all existing content in the string handle str.

Parameters

in	str	String handle.
----	-----	----------------

Return values

0	Success.
EINVAL	Invalid argument.

Examples

example_httpuplds.c.

5.4 String map

Data Structures

· struct sg strmap

Typedefs

- typedef int(* sg_strmap_iter_cb) (void *cls, struct sg_strmap *pair)
- typedef int(* sg_strmap_sort_cb) (void *cls, struct sg_strmap *pair_a, struct sg_strmap *pair_b)

Functions

- const char * sg_strmap_name (struct sg_strmap *pair)
- const char * sg_strmap_val (struct sg_strmap *pair)
- int sg_strmap_add (struct sg_strmap **map, const char *name, const char *val)
- int sg_strmap_set (struct sg_strmap **map, const char *name, const char *val)
- int sg_strmap_find (struct sg_strmap *map, const char *name, struct sg_strmap **pair)
- const char * sg_strmap_get (struct sg_strmap *map, const char *name)
- int sg_strmap_rm (struct sg_strmap **map, const char *name)
- int sg_strmap_iter (struct sg_strmap *map, sg_strmap_iter_cb cb, void *cls)
- int sg_strmap_sort (struct sg_strmap **map, sg_strmap_sort_cb cb, void *cls)
- unsigned int sg_strmap_count (struct sg_strmap *map)
- int sg strmap next (struct sg strmap **next)
- void sg_strmap_cleanup (struct sg_strmap **map)

5.4.1 Detailed Description

String map handle and its related functions.

5.4.2 Typedef Documentation

5.4.2.1 sg_strmap_iter_cb

```
typedef int(* sg_strmap_iter_cb) (void *cls, struct sg_strmap *pair)
```

Callback signature used by sg_strmap_iter() to iterate pairs of strings.

Parameters

out	cls	User-defined closure.
out	pair	Current iterated pair.

0 Success.	
E <error></error>	User-defined error to stop pairs iteration.

5.4 String map 19

5.4.2.2 sg_strmap_sort_cb

```
typedef int(* sg_strmap_sort_cb) (void *cls, struct sg_strmap *pair_a, struct sg_strmap *pair← b)
```

Callback signature used by sg_strmap_sort() to sort pairs of strings.

Parameters

out	cls	User-defined closure.
out	pair⇔	Current left pair (A).
	_a	
out	pair⊷	Current right pair (B).
	_b	

Return values

-1	A < B.
0	A == B.
1	A > B.

5.4.3 Function Documentation

5.4.3.1 sg_strmap_name()

Returns a name from the pair.

Parameters

in	pair	Pair of name-value.

Returns

Name as null-terminated string.

Return values

NULL If the	he pair is null and sets the errno to EINVAL.
-------------	---

Examples

example_strmap.c.

5.4.3.2 sg_strmap_val()

Returns a value from the pair.

Parameters

in	pair	Pair of name-value.
	, ,	

Returns

Value as null-terminated string.

Return values

```
NULL If the pair is null and sets the errno to EINVAL.
```

Examples

example_strmap.c.

5.4.3.3 sg_strmap_add()

Adds a pair of name-value to the string map.

Parameters

in,out	map	Pairs map pointer to add a new pair.
in	name	Pair name.
in	val	Pair value.

Return values

0	Success.
EINVAL	Invalid argument.
ENOMEM	Out of memory.

Note

It cannot check if a name already exists in a pair added to the map, then the uniqueness must be managed by the application.

5.4 String map 21

5.4.3.4 sg_strmap_set()

Sets a pair of name-value to the string map.

Parameters

in,out	тар	map Pairs map pointer to set a new pair.	
in	name	Pair name.	
in	val	Pair value.	

Return values

0	Success.
EINVAL	Invalid argument.
ENOMEM	Out of memory.

Note

If a name already exists in a pair previously added into the **map**, then the function replaces its value, otherwise it is added as a new pair.

Examples

example_strmap.c.

5.4.3.5 sg_strmap_find()

Finds a pair by name.

Parameters

in	тар	Pairs map.	
in	name	Name to find the pair.	
in,out	pair	Pointer of the variable to store the found pair.	

0	Success.
EINVAL	Invalid argument.
ENOENT	Pair not found.
ENOMEM	Out of memory.

Examples

example_strmap.c.

5.4.3.6 sg_strmap_get()

Gets a pair by name and returns the value.

Parameters

in	тар	Pairs map.
in	name	Name to get the pair.

Returns

Pair value as null-terminated string.

Return values

If map o	name is nul	II or pair is not found.
----------	--------------------	--------------------------

Examples

example_httpcomp.c, example_httpcookie.c, and example_httpuplds.c.

5.4.3.7 sg_strmap_rm()

Removes a pair by name.

Parameters

in	map	Pointer to the pairs map.
in	name	Name to find and then remove the pair.

0	Success.
EINVAL	Invalid argument.
ENOENT	Pair already removed.

5.4 String map 23

Return values

ENOMEM	Out of memory.
--------	----------------

5.4.3.8 sg_strmap_iter()

Iterates over pairs map.

Parameters

in	тар	Pairs map.
in	cb	Callback to iterate the pairs.
in,out	cls	User-specified value.

Return values

0	Success.
EINVAL	Invalid argument.

Returns

Callback result when it is different from 0.

Examples

example_strmap.c.

5.4.3.9 sg_strmap_sort()

Sorts the pairs map.

Parameters

in,out	тар	Pointer to the pairs map.
in	cb	Callback to sort the pairs.
in,out	cls	User-specified value.

Return values

0	Success.
EINVAL	Invalid argument.

Examples

example_strmap.c.

5.4.3.10 sg_strmap_count()

```
unsigned int sg_strmap_count ( struct \ sg\_strmap * \textit{map} )
```

Counts the total pairs in the map.

Parameters

in <i>map</i>	Pairs map.
---------------	------------

Returns

Total of pairs.

Return values

0 If the list is empty or null.

5.4.3.11 sg_strmap_next()

Returns the next pair in the map.

Parameters

in,out	next	Pointer to the next pair.
--------	------	---------------------------

0	Success.
EINVAL	Invalid argument.

5.4 String map 25

5.4.3.12 sg_strmap_cleanup()

Cleans the entire map.

Parameters

in,out	тар	Pointer to the pairs map.
--------	-----	---------------------------

Examples

example_strmap.c.

5.5 HTTP server

Data Structures

- · struct sg_httpauth
- struct sg httpupld
- struct sg_httpreq
- · struct sg httpres
- · struct sg httpsrv

Macros

- #define sg_httpres_send(res, val, content_type, status) sg_httpres_sendbinary((res), (void *) (val), (((val) != NULL) ? strlen((val)) : 0), (content_type), (status))

5.5.1 Detailed Description

Fast event-driven HTTP server.

5.5.2 Macro Definition Documentation

5.5.2.1 sg_httpres_send

Sends a null-terminated string content to the client.

Parameters

in	res	Response handle.
in	val	Null-terminated string.
in	content_type	Content type.
in	status	HTTP status code.

Return values

0	Success.	
EINVAL	Invalid argument.	
EALREADY	Operation already in progress.	
ENOMEM	Out of memory.	

Examples

example_httpauth.c, example_httpcookie.c, example_httpreq_payload.c, example_httpsrv.c, example_httpsrv_benchmark.c, example_httpsrv_tls.c, example_httpsrv_tls_cert_auth.c, example_httpuplds.c, and example_router_srv.c.

5.5 HTTP server 29

5.5.2.2 sg_httpres_download

Offer a file as download.

Parameters

in	res	Response handle.
in	filename	Path of the file to be sent.

Return values

0	Success.	
EINVAL	Invalid argument.	
EALREADY	Operation already in progress.	
EISDIR	Is a directory.	
EBADF	Bad file number.	
ENOMEM	Out of memory.	

Examples

example_httpuplds.c.

5.5.2.3 sg_httpres_render

Sends a file to be rendered.

Parameters

in	res	Response handle.
in	filename	Path of the file to be sent.

0	Success.	
EINVAL	Invalid argument.	
EALREADY	Operation already in progress.	
EISDIR	Is a directory.	
EBADF	Bad file number.	
ENOMEM	Out of memory.	

5.5.2.4 sg_httpres_zsend

Compresses a null-terminated string content and sends it to the client. The compression is done by zlib library using the DEFLATE compression algorithm.

Parameters

in	res	Response handle.
in	val	Null-terminated string.
in	content_type	Content type.
in	status	HTTP status code.

Return values

0	Success.
EINVAL	Invalid argument.
ENOMEM	Out of memory.
ENOBUFS	No buffer space available.
EALREADY	Operation already in progress.
Z_ <error></error>	zlib error as negative number.

Note

When compression succeeds, the header ${\tt Content-Encoding:} \quad {\tt deflate}$ is automatically added to the response.

5.5.2.5 sg_httpres_zdownload

Compresses a file in Gzip format and offer it as download. The compression is done by zlib library using the DEFLATE compression algorithm.

Parameters

in	res	Response handle.	
in	filename	Path of the file to be compressed and sent.	

5.5 HTTP server 31

Return values

0	Success.
EINVAL	Invalid argument.
EALREADY	Operation already in progress.
EISDIR	Is a directory.
EBADF	Bad file number.
ENOMEM	Out of memory.
Z_ <error></error>	zlib error as negative number.

Note

When compression succeeds, the header <code>Content-Encoding: gzip</code> is automatically added to the response.

5.5.2.6 sg_httpres_zrender

Compresses a file in Gzip formant and sends it to be rendered. The compression is done by zlib library using the DEFLATE compression algorithm.

Parameters

in	res	Response handle.
in	filename	Path of the file to be sent.

Return values

0	Success.
EINVAL	Invalid argument.
EALREADY	Operation already in progress.
EISDIR	Is a directory.
EBADF	Bad file number.
ENOMEM	Out of memory.
Z_ <error></error>	zlib error as negative number.

Note

When compression succeeds, the header Content-Encoding: gzip is automatically added to the response.

5.5.3 Typedef Documentation

5.5.3.1 sg_httpauth_cb

typedef bool(* sg_httpauth_cb) (void *cls, struct sg_httpauth *auth, struct sg_httpreq *req,
struct sg_httpres *res)

Callback signature used to grant or deny the user access to the server resources.

Parameters

out	cls	User-defined closure.
out	auth	Authentication handle.
out	req	Request handle.
out	res	Response handle.

Return values

true	Grants the user access.
false	Denies the user access.

5.5.3.2 sg_httpupId_cb

typedef int(* sg_httpupld_cb) (void *cls, void **handle, const char *dir, const char *field, const char *name, const char *mime, const char *encoding)

Callback signature used to handle uploaded files and/or fields.

Parameters

out	cls	User-defined closure.
in,out	handle	Stream handle pointer.
out	dir	Directory to store the uploaded files.
out	field	Posted field.
out	name	Uploaded file name.
out	mime	Uploaded file content-type (e.g.: text/plain, image/png,
		application/json etc.).
out	encoding	Uploaded file transfer-encoding (e.g.: chunked, deflate, gzip etc.).

Return values

0	Success.
E <error></error>	User-defined error to refuse the upload.

5.5.3.3 sg_httpuplds_iter_cb

 ${\tt typedef\ int(*\ sg_httpuplds_iter_cb)\ (void\ *cls,\ struct\ sg_httpupld\ *upld)}$

Callback signature used to iterate uploaded files.

5.5 HTTP server 33

Parameters

out	cls	User-defined closure.
out	upld	Current upload item.

Return values

0	Success.
E <error></error>	User-defined error to stop list iteration.

5.5.3.4 sg_httpreq_cb

```
typedef void(* sg_httpreq_cb) (void *cls, struct sg_httpreq *req, struct sg_httpres *res)
```

Callback signature used to handle requests and responses.

Parameters

out	cls	User-defined closure.
out	req	Request handle.
out	res	Response handle.

5.5.4 Function Documentation

5.5.4.1 sg_httpauth_set_realm()

Sets the authentication protection space (realm).

Parameters

in	auth	Authentication handle.
in	realm	Realm string.

0	Success.
EINVAL	Invalid argument.
EALREADY	Realm already set.
ENOMEM	Out of memory.

Examples

example_httpauth.c.

5.5.4.2 sg_httpauth_realm()

```
\begin{tabular}{ll} const char* sg_httpauth_realm ( \\ struct sg_httpauth * auth ) \end{tabular}
```

Gets the authentication protection space (realm).

Parameters

in auth Authentication ha	andle.
---------------------------	--------

Returns

Realm as null-terminated string.

Return values

```
NULL If auth is null and sets the errno to EINVAL.
```

5.5.4.3 sg_httpauth_deny2()

Deny the authentication sending a justification to the user.

Parameters

in	auth	Authentication handle.
in	reason	Denial reason.
in	content_type	Content type.
in	status	HTTP status code.

Return values

0	Success.
EINVAL	Invalid argument.
EALREADY	Already denied.
ENOMEM	Out of memory.

5.5.4.4 sg_httpauth_deny()

Deny the authentication sending a justification to the user.

Parameters

in	auth	Authentication handle.
in	reason	Denial reason.
in	content_type	Content type.

Return values

0	Success.
EINVAL	Invalid argument.
EALREADY	Already denied.
ENOMEM	Out of memory.

Examples

example_httpauth.c.

5.5.4.5 sg_httpauth_cancel()

Cancels the authentication loop while the user is trying to acess the server.

Parameters

in	auth	Authentication handle.

Return values

0	Success.
EINVAL	Invalid argument.

5.5.4.6 sg_httpauth_usr()

Returns the authentication user.

Parameters

Returns

User as null-terminated string.

Return values

```
NULL If auth is null and sets the errno to EINVAL.
```

Examples

```
example_httpauth.c.
```

5.5.4.7 sg_httpauth_pwd()

Returns the authentication password.

Parameters

in	auth	Authentication handle.

Returns

Password as null-terminated string.

Return values

```
NULL If auth is null and sets the errno to EINVAL.
```

Examples

```
example_httpauth.c.
```

5.5.4.8 sg_httpuplds_iter()

Iterates over all the upload items in the **uplds** list.

Parameters

in	uplds	Uploads list handle.
in	cb	Callback to iterate over upload items.
in	cls	User-defined closure.

Return values

0	Success.
EINVAL	Invalid argument.
E <error></error>	User-defined error to abort the list iteration.

5.5.4.9 sg_httpuplds_next()

Gets the next upload item starting from the first item pointer upld.

Parameters

	in,out	upld	Next upload item starting from the first item pointer.	1
--	--------	------	--	---

Return values

0	Success.
EINVAL	Invalid argument.

Examples

 $example_httpuplds.c.$

5.5.4.10 sg_httpuplds_count()

Counts the total upload items in the list ${\tt uplds}$.

Parameters

i didiliotoro		
in	uplds	Uploads list.

Returns

Total of items.

Return values

0 If the list is empty or null.

5.5.4.11 sg_httpupId_handle()

Returns the stream handle of the upload handle upld.

Parameters

in <i>upld</i> Upload handl

Returns

Stream handle.

Return values

NULL If **upld** is null and sets the errno to EINVAL.

5.5.4.12 sg_httpupId_dir()

Returns the directory of the upload handle upld.

Parameters

in	upld	Upload handle.
----	------	----------------

Returns

Upload directory as null-terminated string.

Return values

NULL If **upld** is null and sets the errno to EINVAL.

5.5.4.13 sg_httpupId_field()

```
const char* sg_httpupld_field (
```

```
struct sg_httpupld * upld )
```

Returns the field of the upload handle upld.

Parameters

in	upld	Upload handle.
----	------	----------------

Returns

Upload field as null-terminated string.

Return values

```
NULL If upld is null and sets the errno to EINVAL.
```

5.5.4.14 sg_httpupId_name()

Returns the name of the upload handle upld.

Parameters

in	upld	Upload handle.

Returns

Upload name as null-terminated string.

Return values

```
NULL If upld is null and sets the errno to EINVAL.
```

Examples

example_httpuplds.c.

5.5.4.15 sg_httpupId_mime()

Returns the MIME (content-type) of the upload.

Parameters

in	upld	Upload handle.

Returns

Upload MIME as null-terminated string.

Return values

```
NULL If upld is null and sets the errno to EINVAL.
```

5.5.4.16 sg_httpupId_encoding()

Returns the encoding (transfer-encoding) of the upload.

Parameters

in upld Upload har	ndle.
--------------------	-------

Returns

Upload encoding as null-terminated string.

Return values

```
NULL If upld is null and sets the errno to EINVAL.
```

5.5.4.17 sg_httpupId_size()

Returns the size of the upload.

Parameters

in	blau	Upload handle.
	apia	opioda nandio.

Returns

Upload size into uint 64. If upld is null, sets the errno to EINVAL.

5.5.4.18 sg_httpupId_save()

Saves the uploaded file defining the destination path by upload name and directory.

Parameters

in	upld	Upload handle.
in	overwritten	Overwrite upload file if it exists.

Return values

0	Success.
EINVAL	Invalid argument.
EEXIST	File already exists (if overwritten is false).
EISDIR	Destination file is a directory.

Examples

example_httpuplds.c.

5.5.4.19 sg_httpupId_save_as()

Saves the uploaded file allowing to define the destination path.

Parameters

in	upld	Upload handle.
in	path	Absolute destination path.
in	overwritten	Overwrite upload file if it exists.

Return values

0	Success.
EINVAL	Invalid argument.
EEXIST	File already exists (if overwritten is true).
EISDIR	Destination file is a directory.

5.5.4.20 sg_httpreq_headers()

Returns the client headers into sg_strmap map.

Parameters

in	req	Request handle.
----	-----	-----------------

Returns

Reference to the client headers map.

Return values

```
NULL If req is null and sets the errno to EINVAL
```

Note

The headers map is automatically freed by the library.

Examples

example_httpcomp.c.

5.5.4.21 sg_httpreq_cookies()

Returns the client cookies into sg_strmap map.

Parameters

in	req	Request handle.

Returns

Reference to the client cookies map.

Return values

NULL If req is null and sets the errno to EINVAL

Note

The cookies map is automatically freed by the library.

Examples

```
example_httpcookie.c.
```

5.5.4.22 sg_httpreq_params()

Returns the query-string into sg_strmap map.

Parameters

in <i>req</i>	Request handle.
---------------	-----------------

Returns

Reference to the query-string map.

Return values

```
NULL If req is null and sets the errno to EINVAL
```

Note

The query-string map is automatically freed by the library.

Examples

```
example\_httpuplds.c.
```

5.5.4.23 sg_httpreq_fields()

Returns the fields of a HTML form into sg_strmap map.

Parameters

in	req	Request handle.

Returns

Reference to the form fields map.

Return values

```
NULL If req is null and sets the errno to EINVAL
```

Note

The form fields map is automatically freed by the library.

5.5.4.24 sg_httpreq_version()

Returns the HTTP version.

Parameters

in	req	Request handle.

Returns

HTTP version as null-terminated string.

Return values

```
NULL If req is null and sets the errno to EINVAL.
```

5.5.4.25 sg_httpreq_method()

Returns the HTTP method.

Parameters

in	req	Request handle.

Returns

HTTP method as null-terminated string.

Return values

NULL If req is null and sets the errno to EINVAL.

5.5.4.26 sg_httpreq_path()

Returns the path component.

Parameters

in rea Request handle			
	in	rea	Request handle.

Returns

Path component as null-terminated string.

Return values

NULL If req is null and sets the errno to EINVAL.

Examples

example_httpcookie.c, and example_router_srv.c.

5.5.4.27 sg_httpreq_payload()

Returns the posting payload into a sg_str instance.

Parameters

in req Request handle

Returns

Instance of the payload.

Return values

NULL If req is null and sets the errno to EINVAL.

Note

The form payload instance is automatically freed by the library.

Examples

example_httpreq_payload.c.

5.5.4.28 sg_httpreq_is_uploading()

```
bool sg_httpreq_is_uploading ( struct \ sg_httpreq * req )
```

Checks if the client is uploading data.

Parameters

in <i>req</i>	Request handle.
---------------	-----------------

Return values

true If the client is uploading data, false otherwise. If req is null, sets the errno to EINVAL.

Examples

 $example_httpuplds.c.$

5.5.4.29 sg_httpreq_uploads()

Returns the list of the uploaded files.

Parameters

in	req	Request handle.
----	-----	-----------------

Returns

List of the uploaded files.

Return values

NULL If req is null and sets the errno to EINVAL.

Note

The uploads list is automatically freed by the library.

Examples

 $example_httpuplds.c.$

5.5.4.30 sg_httpreq_client()

Gets the socket handle of the client.

Parameters

in <i>req</i>	Request handle.
---------------	-----------------

Returns

Socket address of the client.

Return values

```
NULL If req is null and sets the errno to EINVAL.
```

5.5.4.31 sg_httpreq_tls_session()

Returns the GnuTLS session handle.

Parameters

in	req	Request handle.

Return values

0	Success.
EINVAL	Invalid argument.

Examples

example_httpsrv_tls_cert_auth.c.

5.5.4.32 sg_httpreq_set_user_data()

Sets user data to the request handle.

Parameters

in	req	Request handle.
in	data	User data pointer.

Return values

0	Success.
EINVAL	Invalid argument.

5.5.4.33 sg_httpreq_user_data()

Gets user data from the request handle.

Parameters

in	req	Request handle.
----	-----	-----------------

Returns

User data pointer.

Return values

NULL If req is null and sets the errno to EINVAL.

5.5.4.34 sg_httpres_headers()

Returns the server headers into sg_strmap map.

Parameters

in	res	Response handle.

Returns

Reference to the server headers map.

Return values

```
NULL If res is null and sets the errno to EINVAL
```

Note

The headers map is automatically freed by the library.

5.5.4.35 sg_httpres_set_cookie()

```
int sg_httpres_set_cookie (
          struct sg_httpres * res,
          const char * name,
          const char * val )
```

Sets server cookie to the response handle.

Parameters

in	res	Response handle.
in	name	Cookie name.
in	val	Cookie value.

Return values

0	Success.
EINVAL	Invalid argument.
ENOMEM	Out of memory.

Examples

example_httpcookie.c.

5.5.4.36 sg_httpres_sendbinary()

Sends a binary content to the client.

Parameters

in	res	Response handle.
in	buf	Binary content.
in	size	Content size.
in	content_type	Content type.
in	status	HTTP status code.

Return values

0	Success.
EINVAL	Invalid argument.
EALREADY	Operation already in progress.
ENOMEM	Out of memory.

Examples

example_httpcomp.c.

5.5.4.37 sg_httpres_sendfile2()

Sends a file to the client.

Parameters

in	res	Response handle.
in	size	Size of the file to be sent. Use zero to calculate automatically.
in	max_size	Maximum allowed file size. Use zero for no limit.
in	offset	Offset to start reading from in the file to be sent.
in	filename	Path of the file to be sent.
in	disposition	Content disposition as null-terminated string (attachment or inline).
in	status	HTTP status code.

Return values

0	Success.
EINVAL	Invalid argument.
EALREADY	Operation already in progress.
EISDIR	Is a directory.
EBADF	Bad file number.
EFBIG	File too large.

Return values

ENOMEM	Out of memory.
--------	----------------

Warning

The parameter ${\tt disposition}$ is not checked internally, thus any non-NULL value is passed directly to the header ${\tt Content-Disposition}$.

5.5.4.38 sg_httpres_sendfile()

```
int sg_httpres_sendfile (
    struct sg_httpres * res,
    uint64_t size,
    uint64_t max_size,
    uint64_t offset,
    const char * filename,
    bool downloaded,
    unsigned int status)
```

Sends a file to the client.

Parameters

in	res	Response handle.
in	size Size of the file to be sent. Use zero to calculate automatical	
in	max_size	Maximum allowed file size. Use zero for no limit.
in	offset	Offset to start reading from in the file to be sent.
in	filename	Path of the file to be sent.
in	downloaded	If true it offer the file as download.
in	status	HTTP status code.

Return values

0	Success.
EINVAL	Invalid argument.
EALREADY	Operation already in progress.
EISDIR	Is a directory.
EBADF	Bad file number.
EFBIG	File too large.
ENOMEM	Out of memory.

5.5.4.39 sg_httpres_sendstream()

```
sg_read_cb read_cb,
void * handle,
sg_free_cb free_cb,
unsigned int status )
```

Sends a stream to the client.

Parameters

in	res	Response handle.
in	size	Size of the stream.
in	read_cb	Callback to read data from stream handle.
in	handle	Stream handle.
in	free_cb	Callback to free the stream handle.
in	status	HTTP status code.

Return values

0	Success.
EINVAL	Invalid argument.
EALREADY	Operation already in progress.
ENOMEM	Out of memory.

Note

Use size = 0 if the stream size is unknown.

5.5.4.40 sg_httpres_zsendbinary2()

```
int sg_httpres_zsendbinary2 (
    struct sg_httpres * res,
    int level,
    void * buf,
    size_t size,
    const char * content_type,
    unsigned int status )
```

Compresses a binary content and sends it to the client. The compression is done by zlib library using the DEFLATE compression algorithm.

Parameters

in	res	Response handle.
in	level	Compression level (19 or -1 for default).
in	buf	Binary content.
in	size	Content size.
in	content_type	Content type.
in	status	HTTP status code.

Return values

0	Success.
EINVAL	Invalid argument.
ENOMEM	Out of memory.
ENOBUFS	No buffer space available.
EALREADY	Operation already in progress.
Z_ <error></error>	zlib error as negative number.

Note

When compression succeeds, the header Content-Encoding: deflate is automatically added to the response.

5.5.4.41 sg_httpres_zsendbinary()

Compresses a binary content and sends it to the client. The compression is done by zlib library using the DEFLATE compression algorithm.

Parameters

in	res	Response handle.
in	buf	Binary content.
in	size	Content size.
in	content_type	Content type.
in	status	HTTP status code.

Return values

0	Success.
EINVAL	Invalid argument.
ENOMEM	Out of memory.
ENOBUFS	No buffer space available.
EALREADY	Operation already in progress.
Z_ <error></error>	zlib error as negative number.

Note

When compression succeeds, the header <code>Content-Encoding:</code> deflate is automatically added to the response.

Examples

example_httpcomp.c.

5.5.4.42 sg_httpres_zsendstream2()

Compresses a stream and sends it to the client. The compression is done by zlib library using the DEFLATE compression algorithm.

Parameters

in	res	Response handle.
in	level	Compression level (19 or -1 for default).
in	size	Size of the stream.
in	read_cb	Callback to read data from stream handle.
in	handle	Stream handle.
in	free_cb	Callback to free the stream handle.
in	status	HTTP status code.

Return values

0	Success.
EINVAL	Invalid argument.
EALREADY	Operation already in progress.
ENOMEM	Out of memory.
Z_ <error></error>	zlib error as negative number.

Note

When compression succeeds, the header Content-Encoding: deflate is automatically added to the response.

5.5.4.43 sg_httpres_zsendstream()

Compresses a stream and sends it to the client. The compression is done by zlib library using the DEFLATE compression algorithm.

Parameters

in	res	Response handle.
in	read_cb	Callback to read data from stream handle.
in	handle	Stream handle.
in	free_cb	Callback to free the stream handle.
in	status	HTTP status code.

Return values

0	Success.
EINVAL	Invalid argument.
EALREADY	Operation already in progress.
ENOMEM	Out of memory.
Z_ <error></error>	zlib error as negative number.

Note

When compression succeeds, the header <code>Content-Encoding:</code> deflate is automatically added to the response.

5.5.4.44 sg_httpres_zsendfile2()

```
int sg_httpres_zsendfile2 (
    struct sg_httpres * res,
    int level,
    uint64_t size,
    uint64_t max_size,
    uint64_t offset,
    const char * filename,
    const char * disposition,
    unsigned int status )
```

Compresses a file in Gzip format and sends it to the client. The compression is done by zlib library using the DEFLATE compression algorithm.

Parameters

in	res	Response handle.
in	level	Compression level (19 or -1 for default).
in	size	Size of the file to be sent. Use zero to calculate automatically.
in	max_size	Maximum allowed file size. Use zero for no limit.
in	offset	Offset to start reading from in the file to be sent.
in	filename	Path of the file to be sent.
in	disposition	Content disposition as null-terminated string (attachment or inline).
in	status	HTTP status code.

Return values

0	Success.

Return values

EINVAL	Invalid argument.
EALREADY	Operation already in progress.
EISDIR	Is a directory.
EBADF	Bad file number.
EFBIG	File too large.
ENOMEM	Out of memory.
Z_ <error></error>	zlib error as negative number.

Note

When compression succeeds, the header <code>Content-Encoding: gzip</code> is automatically added to the response.

Warning

The parameter disposition is not checked internally, thus any non-NULL value is passed directly to the header Content-Disposition.

5.5.4.45 sg_httpres_zsendfile()

Compresses a file in Gzip format and sends it to the client. The compression is done by zlib library using the DEFLATE compression algorithm.

Parameters

in	res	Response handle.
in	size	Size of the file to be sent. Use zero to calculate automatically.
in	max_size	Maximum allowed file size. Use zero for no limit.
in	offset	Offset to start reading from in the file to be sent.
in	filename	Path of the file to be sent.
in	downloaded	If true it offer the file as download.
in	status	HTTP status code.

Return values

0	Success.
EINVAL	Invalid argument.
EALREADY	Operation already in progress.
EISDIR	Is a directory.

Return values

EBADF	Bad file number.
EFBIG	File too large.
ENOMEM	Out of memory.
Z_ <error></error>	zlib error as negative number.

Note

When compression succeeds, the header <code>Content-Encoding: gzip</code> is automatically added to the response.

5.5.4.46 sg_httpres_clear()

Clears all headers, cookies, status and internal buffers of the response handle.

Parameters

in	res	Response handle.
----	-----	------------------

Return values

0	Success.
EINVAL	Invalid argument.

5.5.4.47 sg_httpsrv_new2()

Creates a new HTTP server handle.

Parameters

in	auth_cb	Callback to grant/deny user access to the server resources.
in	req_cb	Callback to handle requests and responses.
in	err_cb	Callback to handle server errors.
in	cls	User-defined closure.

Returns

New HTTP server handle.

Return values

NULL	If no memory space is available.	
NULL	If the req_cb or err_cb is null and sets the errno to EINVAL.	

Examples

example_httpauth.c.

5.5.4.48 sg_httpsrv_new()

Creates a new HTTP server handle.

Parameters

in	cb	Callback to handle requests and responses.	
in	cls	cls User-defined closure.	

Returns

New HTTP server handle.

Return values

```
NULL If the cb is null and sets the errno to EINVAL.
```

Examples

example_httpcomp.c, example_httpcookie.c, example_httpreq_payload.c, example_httpsrv.c, example_httpsrv_benchmark.c, example_httpsrv_tls.c, example_httpsrv_tls.

5.5.4.49 sg_httpsrv_free()

Frees the server handle previously allocated by sg_httpsrv_new() or sg_httpsrv_new2().

Parameters

i	n	srv	Pointer of the server to be freed.	1
---	---	-----	------------------------------------	---

Note

If the server is running it stops before being freed.

Examples

example_httpauth.c, example_httpcomp.c, example_httpcookie.c, example_httpreq_payload.c, example_httpsrv.c, example_httpsrv_tls.c, example_httpsrv_tls_cert_auth.c, example_httpsrv_tls_cert_auth.c, example_httpuplds.c, and example_router_srv.c.

5.5.4.50 sg_httpsrv_tls_listen2()

Starts the HTTPS server.

Parameters

in	srv	Server handle.	
in	key	Memory pointer for the private key (key.pem) to be used by the HTTPS server.	
in	pwd	Password for the private key.	
in	cert	Memory pointer for the certificate (cert.pem) to be used by the HTTPS server.	
in	trust	Memory pointer for the certificate (ca.pem) to be used by the HTTPS server for client	
		authentication.	
in	dhparams	Memory pointer for the Diffie Hellman parameters (dh.pem) to be used by the HTTPS	
		server for key exchange.	
in	port	Port for listening to connections.	
in	threaded	Enable/disable the threaded model. If true, the server creates one thread per	
		connection.	

Return values

```
true If the server is started, false otherwise. If srv is null, sets the errno to EINVAL.
```

Note

If port is 0, the operating system will assign an unused port randomly.

Examples

```
example_httpsrv_tls_cert_auth.c.
```

5.5.4.51 sg_httpsrv_tls_listen()

Starts the HTTPS server.

Parameters

in	srv	Server handle.	
in	key	Memory pointer for the private key (key.pem) to be used by the HTTPS server.	
in	cert	Memory pointer for the certificate (cert.pem) to be used by the HTTPS server.	
in	port	Port for listening to connections.	
in	threaded	Enable/disable the threaded model. If true, the server creates one thread per connection.	

Return values

```
true If the server is started, false otherwise. If srv is null, sets the errno to EINVAL.
```

Note

If port is $\ 0$, the operating system will assign an unused port randomly.

Examples

```
example_httpsrv_tls.c.
```

5.5.4.52 sg_httpsrv_listen()

Starts the HTTP server.

Parameters

in	srv	Server handle.	
in	port	Port for listening to connections.	
in	threaded	Enable/disable the threaded model. If true, the server creates one thread per connection.	

Return values

Note

If port is 0, the operating system will assign randomly an unused port.

Examples

example_httpauth.c, example_httpcomp.c, example_httpcookie.c, example_httpreq_payload.c, example_httpsrv.c, example_httpsrv_benchmark.c, example_httpuplds.c, and example_router_srv.c.

5.5.4.53 sg_httpsrv_shutdown()

```
int sg_httpsrv_shutdown (  struct \ sg_httpsrv * srv )
```

Stops the server not to accept new connections.

Parameters

in <i>srv</i>	Server handle.
---------------	----------------

Return values

0 If the server is stopped. If **srv** is null, sets the errno to EINVAL.

5.5.4.54 sg_httpsrv_port()

Returns the server listening port.

Parameters

in	srv	Server handle.

Returns

Server listening port, 0 otherwise. If **srv** is null, sets the errno to EINVAL.

Examples

example_httpauth.c, example_httpcomp.c, example_httpcookie.c, example_httpreq_payload.c, example_httpsrv.c, example_httpsrv_tls.c, example_httpsrv_tls_cert_auth.c, example_httpsrv_tls_cert_auth.c, example_httpuplds.c, and example_router_srv.c.

5.5.4.55 sg_httpsrv_is_threaded()

Checks if the server was started in threaded model.

Parameters

Return values

true If the server is in threaded model, false otherwise. If srv is null, sets the errno to EINVAL.

5.5.4.56 sg_httpsrv_set_upId_cbs()

Sets the server uploading callbacks.

Parameters

in	srv	Server handle.
in	cb	Callback to handle uploaded files and/or fields.
in	cls	User-defined closure.
in	write_cb	Callback to write the stream of the uploaded files.
in	free_cb	Callback to free stream of the uploaded files.
in	save_cb	Callback to save the uploaded files.
in	save_as_cb	Callback to save the uploaded files defining their path.

Return values

0	Success.
EINVAL	Invalid argument.

5.5.4.57 sg_httpsrv_set_upld_dir()

Sets the directory to save the uploaded files.

Parameters

in	srv	Server handle.
in	dir	Directory as null-terminated string.

Return values

0	Success.
EINVAL	Invalid argument.

5.5.4.58 sg_httpsrv_upld_dir()

Gets the directory of the uploaded files.

Parameters

in <i>srv</i>	Server handle.
---------------	----------------

Returns

Directory as null-terminated string.

Return values

NULL If the srv is null and sets the errno to EINVA	L.
--	----

5.5.4.59 sg_httpsrv_set_post_buf_size()

Sets a size to the post buffering.

Parameters

in	srv	Server handle.
in	size	Post buffering size.

Return values

0	Success.
EINVAL	Invalid argument.

5.5.4.60 sg_httpsrv_post_buf_size()

Gets the size of the post buffering.

Parameters

in <i>srv</i> Se	rver handle.
------------------	--------------

Returns

Post buffering size.

Return values

```
0 If the srv is null and sets the errno to EINVAL.
```

5.5.4.61 sg_httpsrv_set_payld_limit()

Sets a limit to the total payload.

Parameters

in	srv	Server handle.
in	limit	Payload total limit. Use zero for no limit.

Return values

0	Success.
EINVAL	Invalid argument.

5.5.4.62 sg_httpsrv_payld_limit()

Gets the limit of the total payload.

Parameters

in	srv	Server handle.

Returns

Payload total limit.

Return values

0 If the **srv** is null and sets the errno to EINVAL.

5.5.4.63 sg_httpsrv_set_uplds_limit()

Sets a limit to the total uploads.

Parameters

in	srv	Server handle.
in	limit	Uploads total limit. Use zero for no limit.

Return values

0	Success.
EINVAL	Invalid argument.

5.5.4.64 sg_httpsrv_uplds_limit()

```
\label{eq:continuous} \begin{tabular}{ll} uint64\_t & sg\_httpsrv\_uplds\_limit ( \\ & struct & sg\_httpsrv * srv ) \end{tabular}
```

Gets the limit of the total uploads.

Parameters

in <i>srv</i>	Server handle.
---------------	----------------

Returns

Uploads total limit.

Return values

```
0 | If the srv is null and sets the errno to EINVAL.
```

5.5.4.65 sg_httpsrv_set_thr_pool_size()

Sets the size for the thread pool.

Parameters

in	srv	Server handle.	
in	size	Thread pool size. Size greater than 1 enables the thread pooling.	

Return values

0	Success.
EINVAL	Invalid argument.

Examples

example_httpsrv_benchmark.c.

5.5.4.66 sg_httpsrv_thr_pool_size()

Gets the size of the thread pool.

Parameters

in srv Server handle.

Returns

Thread pool size.

Return values

```
0 If the srv is null and sets the errno to EINVAL.
```

5.5.4.67 sg_httpsrv_set_con_timeout()

Sets the inactivity time to a client get time out.

Parameters

in	srv	Server handle.
in	timeout	Timeout (in seconds). Use zero for infinity timeout.

Return values

0	Success.
EINVAL	Invalid argument.

5.5.4.68 sg_httpsrv_con_timeout()

```
unsigned int sg_httpsrv_con_timeout ( {\tt struct~sg\_httpsrv} * srv~)
```

Gets the inactivity time to a client get time out.

Parameters

in <i>srv</i>	Server handle.
---------------	----------------

Returns

Timeout (in seconds).

Return values

0 If the **srv** is null and sets the errno to EINVAL.

5.5.4.69 sg_httpsrv_set_con_limit()

Sets the limit of concurrent connections.

Parameters

in	srv	Server handle.
in	limit	Concurrent connections limit. Use zero for no limit.

Return values

0	Success.
EINVAL	Invalid argument.

Examples

example_httpsrv_benchmark.c.

5.5.4.70 sg_httpsrv_con_limit()

```
unsigned int sg_httpsrv_con_limit ( {\tt struct \ sg\_httpsrv} * srv \ )
```

Gets the limit of concurrent connections.

Parameters

Returns

Concurrent connections limit.

Return values

0 If the **srv** is null and sets the errno to EINVAL.

5.6.1 Detailed Description

High-performance path routing.

5.6.2 Typedef Documentation

5.6.2.1 sg_entrypoints_iter_cb

```
typedef int(* sg_entrypoints_iter_cb) (void *cls, struct sg_entrypoint *entrypoint)
```

Callback signature used by sg_entrypoints_iter() to iterate entry-point items.

Parameters

out	cls	User-defined closure.
out	pair	Current iterated entry-point.

Return values

0	Success.	
E <error></error>	User-defined error to stop the items iteration.	

5.6.2.2 sg_segments_iter_cb

```
typedef int(* sg_segments_iter_cb) (void *cls, unsigned int index, const char *segment)
```

Callback signature used by sg_route_segments_iter() to iterate the path segments.

Parameters

out	cls	User-defined closure.
out	index	Current iterated item index.
out	segment	Current iterated segment.

Return values

0 Success.	
E <error></error>	User-defined error to stop the segments iteration.

5.6.2.3 sg_vars_iter_cb

```
typedef int(* sg_vars_iter_cb) (void *cls, const char *name, const char *val)
```

Callback signature used by sg_route_vars_iter() to iterate the path variables.

Parameters

out	cls	User-defined closure.
out	name	Current iterated variable name.
out	val	Current iterated variable value.

Return values

0 Success.	
E <error></error>	User-defined error to stop the variables iteration.

5.6.2.4 sg_route_cb

```
typedef void(* sg_route_cb) (void *cls, struct sg_route *route)
```

Callback signature used to handle the path routing.

Parameters

out	cls	User-defined closure.
out	route	Route handle.

5.6.2.5 sg_routes_iter_cb

```
typedef int(* sg_routes_iter_cb) (void *cls, struct sg_route *route)
```

Callback signature used by sg_routes_iter() to iterate route items.

Parameters

out	cls	User-defined closure.
out	route	Current iterated route.

Return values

0	Success.	
E <error></error>	User-defined error to stop the route items iteration.	

5.6.2.6 sg_router_dispatch_cb

```
typedef int(* sg_router_dispatch_cb) (void *cls, const char *path, struct sg_route *route)
```

Callback signature used by sg_router_dispatch2 in the route dispatching loop.

Parameters

out	cls	cls User-defined closure.	
out	path	Route path as null-terminated string.	
out	route	Route handle.	

Return values

0	Success.	
E <error></error>	User-defined error to stop the route dispatching loop.	

5.6.2.7 sg_router_match_cb

```
typedef int(* sg_router_match_cb) (void *cls, struct sg_route *route)
```

Callback signature used by sg_router_dispatch2 when the path matches the pattern before the route dispatching.

Parameters

out	cls	User-defined closure.
out	route	Route handle.

Return values

0	Success.
E <error></error>	User-defined error to stop the route dispatching.

5.6.3 Function Documentation

5.6.3.1 sg_entrypoint_name()

Returns the name of the entry-point handle **entrypoint**.

Parameters

in	entrypoint	Entry-point handle.

Returns

Entry-point name as null-terminated string.

Return values

NULL If the entrypoint is null and sets the errno to EINVAL.

5.6.3.2 sg_entrypoint_set_user_data()

Sets user data to the entry-point handle.

Parameters

in	entrypoint	Entry-point handle.	
in	data	User data pointer.	

Return values

0	Success.
EINVAL	Invalid argument.

5.6.3.3 sg_entrypoint_user_data()

Gets user data from the entry-point handle.

Parameters

in	entrypoint	Entry-point handle.

Returns

User data pointer.

Return values

NULL If entrypoint is null and sets the errno to EINVAL.

Examples

example_entrypoint.c.

5.6.3.4 sg_entrypoints_new()

Creates a new entry-points handle.

Returns

Entry-points handle.

Return values

NULL	If no memory space is available.
------	----------------------------------

Examples

example_entrypoint.c.

5.6.3.5 sg_entrypoints_free()

Frees the entry-points handle previously allocated by sg_entrypoints_new().

Parameters

	in	entrypoints	Pointer of the entry-points to be freed.
--	----	-------------	--

Examples

 $example_entrypoint.c.$

5.6.3.6 sg_entrypoints_add()

Adds a new entry-point item to the entry-points ${\tt entrypoints}.$

Parameters

in	entrypoints	Entry-points handle.	
in	path	Entry-point path.	
in	user data	User data pointer.	

Return values

0	Success.
EINVAL	Invalid argument.
ENOMEM	Out of memory.
EALREADY	Entry-point already added.

Examples

example_entrypoint.c.

5.6.3.7 sg_entrypoints_rm()

Removes an entry-point item from the entry-points **entrypoints**.

Parameters

	in	entrypoints	Entry-points handle.
ſ	in	path	Entry-point path to be removed.

Return values

0	Success.
EINVAL	Invalid argument.
ENOMEM	Out of memory.
ENOENT	Entry-point already removed.

5.6.3.8 sg_entrypoints_iter()

Iterates over entry-point items.

Parameters

in	entrypoints	Entry-points handle.
in	cb	Callback to iterate the entry-point items.
in,out	cls	User-specified value.

Return values

0	Success.
EINVAL	Invalid argument.

Returns

Callback result when it is different from 0.

5.6.3.9 sg_entrypoints_clear()

Clears all existing entry-point items in the entry-points **entrypoints**.

Parameters

in	entrypoints	Entry-points handle.
----	-------------	----------------------

Return values

0	Success.
EINVAL	Invalid argument.

5.6.3.10 sg_entrypoints_find()

Finds an entry-point item by path.

Parameters

in	entrypoints	Entry-points handle.
in,out	entrypoint	Pointer of the variable to store the found entry-point.
in	path	Entry-point path to be found.

Return values

0	Success.
EINVAL	Invalid argument.
ENOMEM	Out of memory.
ENOENT	Pair not found.

Examples

example_entrypoint.c.

5.6.3.11 sg_route_handle()

Returns the PCRE2 handle containing the compiled regex code.

Parameters

in route Route handle.

Returns

PCRE2 handle containing the compiled regex code.

Return values

NULL If route is null and sets the errno to EINVAL.

5.6.3.12 sg_route_match()

Returns the PCRE2 match data created from the route pattern.

Parameters

in route Route handle.

Returns

PCRE2 match data.

Return values

NULL If route is null and sets the errno to EINVAL.

5.6.3.13 sg_route_rawpattern()

Returns the raw route pattern. For example, given a pattern /foo, the raw pattern is $^{\wedge}/foo$ \$.

Parameters

in	route	Route handle.
in	route	Route handle.

Returns

Raw pattern as null-terminated string.

Return values

```
NULL If route is null and sets the errno to EINVAL.
```

5.6.3.14 sg_route_pattern()

Returns the route pattern.

Parameters

Returns

Pattern as null-terminated string.

Return values

NULL	If route is null and sets the errno to EINVAL.
NULL	If no memory space is available and sets the errno to ENOMEM.

Warning

The caller must free the returned value.

5.6.3.15 sg_route_path()

Returns the route path.

Parameters

in <i>route</i>	Route handle.
-----------------	---------------

Returns

Path component as null-terminated string.

Return values

```
NULL If route is null and sets the errno to EINVAL.
```

Examples

example_entrypoint.c, example_router_segments.c, example_router_simple.c, and example_router_vars.c.

5.6.3.16 sg_route_segments_iter()

```
int sg_route_segments_iter (
          struct sg_route * route,
          sg_segments_iter_cb cb,
          void * cls )
```

Iterates over path segments.

Parameters

in	route	Route handle.
in	cb	Callback to iterate the path segments.
in,out	cls	User-specified value.

Return values

0	Success.
EINVAL	Invalid argument.

Returns

Callback result when it is different from 0.

Examples

example_router_segments.c.

5.6.3.17 sg_route_vars_iter()

Iterates over path variables.

Parameters

in	route	Route handle.
in	cb	Callback to iterate the path variables.
in,out	cls	User-specified value.

Return values

0	Success.
EINVAL	Invalid argument.
ENOMEM	Out of memory.

Returns

Callback result when it is different from 0.

Examples

example_router_srv.c, and example_router_vars.c.

5.6.3.18 sg_route_user_data()

Gets user data from the route handle.

Parameters

	in	route	Route handle.
--	----	-------	---------------

Returns

User data pointer.

Return values

NULL If route is null and sets the errno to EINVAL.

Examples

example_router_srv.c.

5.6.3.19 sg_routes_add2()

Adds a route item to the route list **routes**.

Parameters

in,out	routes	Route list pointer to add a new route item.
in,out	route	Pointer of the variable to store the added route reference.
in	pattern	Pattern as null-terminated string. It must be a valid regular expression in PCRE2 syntax.
in,out	errmsg	Pointer of a string to store the error message.
in	errlen	Length of the error message.
in	cb	Callback to handle the path routing.
in	cls	User-defined closure.

Return values

0	Success.
EINVAL	Invalid argument.
EALREADY	Route already added.
ENOMEM	Out of memory.

Note

The pattern is compiled using just-in-time optimization (JIT) when it is supported.

5.6.3.20 sg_routes_add()

Adds a route item to the route list routes. It uses the stderr to print the validation errors.

Parameters

in, ou	it <i>routes</i>	Route list pointer to add a new route item.
in	pattern	Pattern as null-terminated string. It must be a valid regular expression in PCRE2 syntax.
in	cb	Callback to handle the path routing.
in	cls	User-defined closure.

Return values

0	Success.
EINVAL	Invalid argument.
EALREADY	Route already added.
ENOMEM	Out of memory.

Note

The pattern is enclosed between $^{\wedge}$ and \$ automatically if it does not start with $% \left(1,...,N\right) =0$ (.

The escape sequence \K is not supported. It causes EINVAL if used.

The pattern is compiled using just-in-time optimization (JIT) when it is supported.

Examples

 $example_entrypoint.c,\ example_router_segments.c,\ example_router_simple.c,\ example_router_srv.c,\ and\ example_router_vars.c.$

5.6.3.21 sg_routes_rm()

Removes a route item from the route list **routes**.

Parameters

in,out	routes	Route list pointer to add a new route item.
in	pattern	Pattern as null-terminated string of the route to be removed.

Return values

0	Success.
EINVAL	Invalid argument.
ENOENT	Route already removed.

5.6.3.22 sg_routes_iter()

```
sg_routes_iter_cb cb,
void * cls )
```

Iterates over all the routes in the route list routes.

Parameters

in	routes	Route list handle.
in	cb	Callback to iterate over route items.
in	cls	User-defined closure.

Return values

0	Success.
EINVAL	Invalid argument.
E <error></error>	User-defined error to abort the list iteration.

5.6.3.23 sg_routes_next()

Returns the next route int the route list.

Parameters

in,out	route	Pointer to the next route item.
--------	-------	---------------------------------

Return values

0	Success.
EINVAL	Invalid argument.

5.6.3.24 sg_routes_count()

Counts the total routes in the route list routes.

Parameters

in	routes	Route list handle.

Returns

Total of route items.

Return values

```
0 If the list is empty or null.
```

5.6.3.25 sg_routes_cleanup()

Cleans the entire route list.

Parameters

in, out routes Pointer to the route list.

Examples

 $example_entrypoint.c,\ example_router_segments.c,\ example_router_simple.c,\ example_router_srv.c,\ and\ example_router_vars.c.$

5.6.3.26 sg_router_new()

Creates a new path router handle. It requires a filled route list routes.

Parameters

in	routes	Route list handle.
----	--------	--------------------

Returns

New router handle.

Return values

NULL If the **routes** is null and sets the errno to EINVAL or no memory space.

Examples

example_entrypoint.c, example_router_segments.c, example_router_simple.c, example_router_srv.c, and example_router_vars.c.

5.6.3.27 sg_router_free()

Frees the router handle previously allocated by sg_router_new().

Parameters

in router Router handle

Examples

example_entrypoint.c, example_router_segments.c, example_router_simple.c, example_router_srv.c, and example_router_vars.c.

5.6.3.28 sg_router_dispatch2()

Dispatches a route that its pattern matches the path passed in **path**.

Parameters

in	router	Router handle.
in	path	Path to dispatch a route.
in	user_data	User data pointer to be hold by the route.
in	dispatch_cb	Callback triggered for each route item in the route dispatching loop.
in	cls	User-defined closure passed to the dispatch_cb and match_cb callbacks.
in	match_cb	Callback triggered when the path matches the route pattern.

Return values

0	Success.
EINVAL	Invalid argument.
ENOENT	Route not found or path not matched.
E <error></error>	User-defined error in dispatch_cb or match_cb.

Note

The route callback sg_route_cb is triggered when the path matches the route pattern.

The match logic uses just-in-time optimization (JIT) when it is supported.

5.6.3.29 sg_router_dispatch()

Dispatches a route that its pattern matches the path passed in **path**.

Parameters

in	router	Router handle.
in	path	Path to dispatch a route.
in	user_data	User data pointer to be hold by the route.

Return values

0	Success.
EINVAL	Invalid argument.
ENOENT	Route not found or path not matched.
E <error></error>	User-defined error in dispatch_cb or match_cb.

Note

The route callback sg_route_cb is triggered when the path matches the route pattern.

The match logic uses just-in-time optimization (JIT) when it is supported.

Examples

 $example_entrypoint.c,\ example_router_segments.c,\ example_router_simple.c,\ example_router_srv.c,\ and\ example_router_vars.c.$

6 Data Structure Documentation

6.1 sg_entrypoint Struct Reference

```
#include <sagui.h>
```

6.1.1 Detailed Description

Handle for the entry-point handling. It defines an entry-point to a path or resource. For example, given a path /api1/customer, the part considered as entry-point is /api1.

Examples

```
example_entrypoint.c.
```

The documentation for this struct was generated from the following file:

• sagui.h

6.2 sg_entrypoints Struct Reference

```
#include <sagui.h>
```

6.2.1 Detailed Description

Handle for the entry-point list. It is used to create a list of entry-point sg_entrypoint.

Examples

```
example entrypoint.c.
```

The documentation for this struct was generated from the following file:

• sagui.h

6.3 sg_httpauth Struct Reference

```
#include <sagui.h>
```

6.3.1 Detailed Description

Handle for the HTTP basic authentication.

Examples

```
example_httpauth.c.
```

The documentation for this struct was generated from the following file:

sagui.h

6.4 sg_httpreq Struct Reference

```
#include <sagui.h>
```

6.4.1 Detailed Description

Handle for the request handling. It contains headers, cookies, query-string, fields, payloads, uploads and other data sent by the client.

Examples

example_httpauth.c, example_httpcomp.c, example_httpcookie.c, example_httpreq_payload.c, example_httpsrv.c, example_httpsrv_tls.c, example_httpsrv_tls_cert_auth.c, e

The documentation for this struct was generated from the following file:

• sagui.h

6.5 sg_httpres Struct Reference

```
#include <sagui.h>
```

6.5.1 Detailed Description

Handle for the response handling. It dispatches headers, contents, binaries, files and other data to the client.

Examples

example_httpauth.c, example_httpcomp.c, example_httpcookie.c, example_httpreq_payload.c, example_httpsrv.c, example_httpsrv_tls.c, example_httpsrv_tls_cert_auth.c, example_httpsrv_tls_cert_auth.c, example_httpuplds.c, and example_router_srv.c.

The documentation for this struct was generated from the following file:

• sagui.h

6.6 sg_httpsrv Struct Reference

```
#include <sagui.h>
```

6.6.1 Detailed Description

Handle for the fast event-driven HTTP server.

Examples

example_httpauth.c, example_httpcomp.c, example_httpcookie.c, example_httpreq_payload.c, example_httpsrv.c, example_httpsrv_tls.c, example_httpsrv_tls_cert_auth.c, example_httpsrv_tls_c, and example_router_srv.c.

The documentation for this struct was generated from the following file:

· sagui.h

6.7 sg_httpupId Struct Reference

```
#include <sagui.h>
```

6.7.1 Detailed Description

Handle for the upload handling. It is used to represent a single upload or a list of uploads.

Examples

```
example_httpuplds.c.
```

The documentation for this struct was generated from the following file:

• sagui.h

6.8 sg_route Struct Reference

```
#include <sagui.h>
```

6.8.1 Detailed Description

Handle for the route item. It holds a user data to be dispatched when a path matches the user defined pattern (route pattern).

Examples

example_entrypoint.c, example_router_segments.c, example_router_simple.c, example_router_srv.c, and example_router_vars.c.

The documentation for this struct was generated from the following file:

• sagui.h

6.9 sg_router Struct Reference

```
#include <sagui.h>
```

6.9.1 Detailed Description

Handle for the path router. It holds the reference of a route list to be dispatched.

Examples

example_entrypoint.c, example_router_segments.c, example_router_simple.c, example_router_srv.c, and example_router_vars.c.

The documentation for this struct was generated from the following file:

• sagui.h

6.10 sg_str Struct Reference

```
#include <sagui.h>
```

6.10.1 Detailed Description

Handle for the string structure used to represent a HTML body, POST payload and more.

Examples

example_httpreq_payload.c, example_httpuplds.c, example_router_srv.c, and example_str.c.

The documentation for this struct was generated from the following file:

• sagui.h

6.11 sg_strmap Struct Reference

```
#include <sagui.h>
```

6.11.1 Detailed Description

Handle for hash table that maps name-value pairs. It is useful to represent posting fields, query-string parameter, client cookies and more.

Examples

example_httpcomp.c, example_httpcookie.c, example_httpuplds.c, and example_strmap.c.

The documentation for this struct was generated from the following file:

• sagui.h
